

ABSTRACT OF THE DISCLOSURE

A cellular phone is connected to a portable printer which uses an instant print film through connectors, and the printer prints an image according to image data stored in the cellular phone. The cellular phone can display the image to be printed on its LCD. The user can input information for the printing with push buttons of the cellular phone, and display the information on the LCD. Thus, the portable printer does not need an LCD and push buttons, and therefore the printer is small, light and inexpensive.
